

Recall:How to solve a system of linear equations

system of equations

$$\begin{cases} -x_1 + 2x_2 + 3x_3 = 4 \\ 2x_1 + 6x_3 = 9 \\ 4x_1 - x_2 - 3x_3 = 0 \end{cases}$$

*make  
a matrix*augmented  
matrix*Gauss-Jordan  
elimination*

solutions

$$\begin{cases} x_1 = \dots \\ x_2 = \dots \\ x_3 = \dots \end{cases}$$

*read off  
solutions*matrix in reduced  
row echelon formNext: Some applications of systems of linear equations:

- Computations of traffic flow.
- Balancing chemical equations.
- Google PageRank.

## Computations of traffic flow

**Problem.** Find the flow rate of cars on each segment of streets.

**Note:**

- flow into an intersection = flow out of that intersection
- total flow in = total flow out

## Balancing chemical equations

Burning propane:

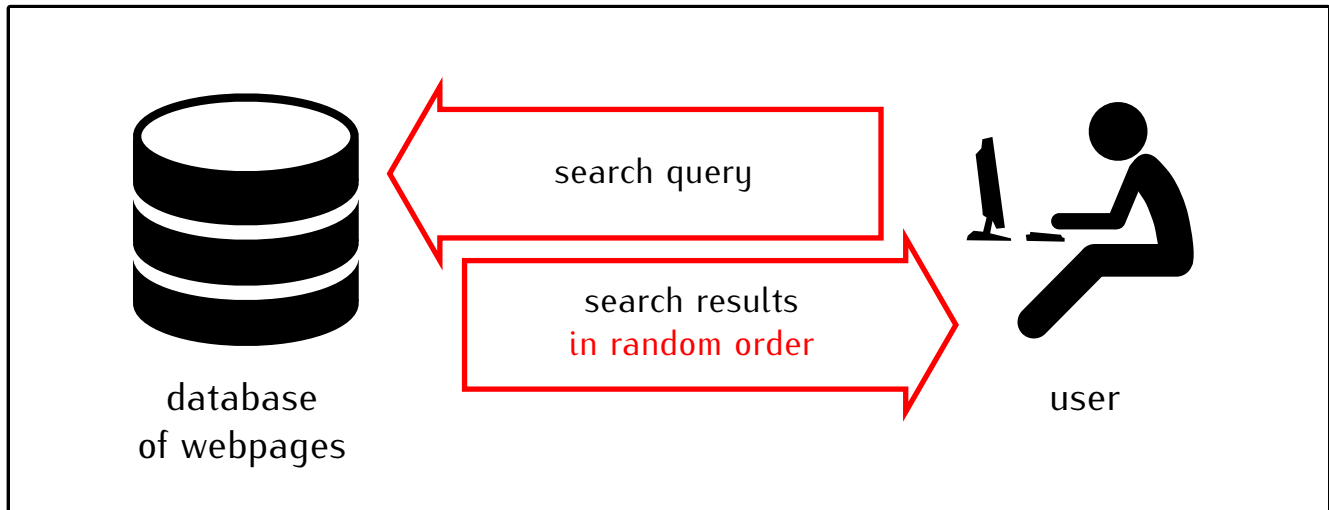

Note:

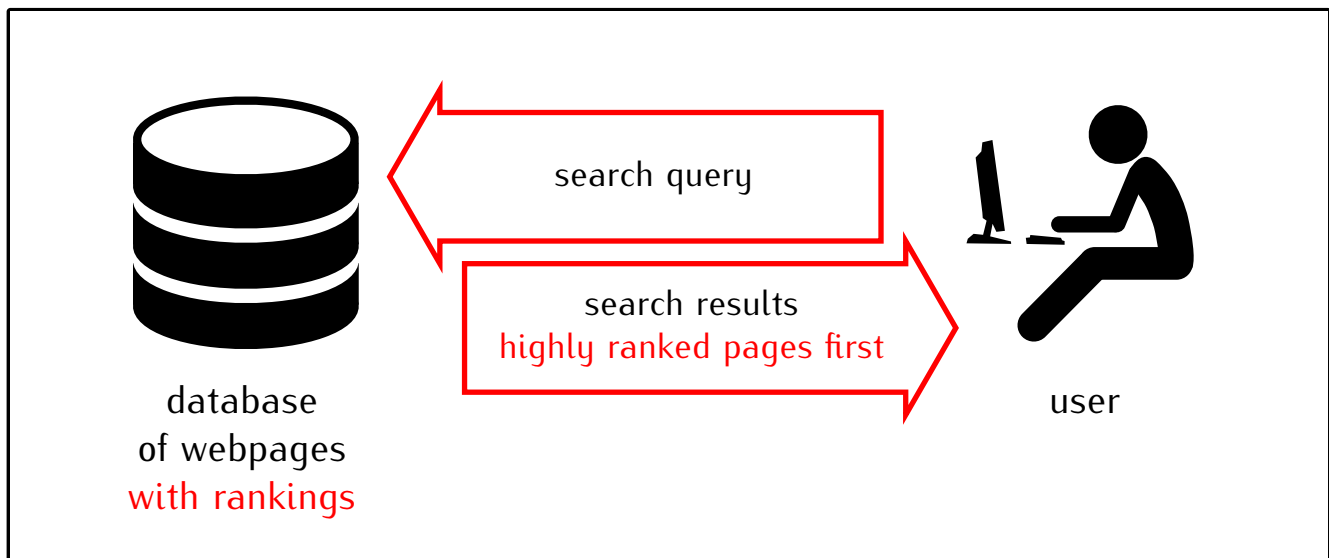

- The numbers  $x_1, x_2, x_3, x_4$  are positive integers.
- The number of atoms of each element on the left side is the same as the number of atoms of that element on the right side.

## Google PageRank

Early search engines:

Google search engine:

## How to rank webpages?

Very simple ranking:

$$\text{ranking of a page} = \left( \begin{array}{c} \text{number of links} \\ \text{pointing to that page} \end{array} \right)$$

*Network of web pages.*

**Problem.** This is very easy to manipulate.

## How to rank webpages?

**Google PageRank:** Links from highly ranked pages are worth more than links from lower ranked pages.

If:

- the rank of a page is  $x$
- the page has  $n$  links to other pages

then each link from that page is worth  $x/n$ .
